

AI & International Visibility Pack

<https://vitadefence.com>

The checks the search audit does not cover · every finding with the finished file that fixes it

AUDITLODGE · <https://vitadefence.com>

Prepared 30 August 2026 at 13:21 · report 20260830-130304-d0561a

Vitadefence Ltd, UK company 15979768

Every check in this document was run against the live site on the date above. Where a check found nothing, it says so — nothing here is estimated, and nothing is invented to fill a gap.

What this document is

6 check(s) produced a file for you.

6 finished file(s) in your pack, ready to install as they stand. 2 check(s) found nothing to fix. 2 check did not complete and claims nothing — see its pack.

6
FILES PRODUCED

2
NOTHING TO FIX

—
CRAWLERS IN

369/421
QUOTABLE

Your search audit measures what is already on your site. This second document is different: each of the checks below **produces a file** — a block of HTML, a robots rule, a text file, a piece of structured data — that you or your developer can put on the site as it stands. Nothing needs rewriting by hand.

Every one of them runs for every customer. If a check finds nothing to fix, its section still appears and says so plainly. A blank section would leave you wondering whether we looked.

1. The language block

If your site exists in more than one language, every version has to point at every other version — including itself — or Google ignores the lot. This is the single most common way a translated site loses its own translations.

What we found

The same block goes in the <head> of every version listed, unchanged

Version	Language	Declared by	Points at
https://vitadefence.com	en-gb	an existing hreflang tag	4

What	Detail
unreachable	URLError: <urlopen error Tunnel connection failed: 502 NO_HOST_CONNECTION>
unreachable	URLError: <urlopen error Tunnel connection failed: 502 NO_HOST_CONNECTION>
outside-head	en-gb tag is not inside <head>
outside-head	nl-nl tag is not inside <head>
outside-head	es-es tag is not inside <head>
outside-head	x-default tag is not inside <head>
target-unread	nl-nl points at https://vitadefence.nl, which could not be read, so the pair cannot be confirmed
target-unread	es-es points at https://vitadefence.es, which could not be read, so the pair cannot be confirmed

The file this produces

The finished block of HTML to paste into the <head> of every language version.

```
<!-- for https://vitadefence.com -->
<link rel="alternate" hreflang="en-gb" href="https://vitadefence.com" />
<link rel="alternate" hreflang="x-default" href="https://vitadefence.com" />
```

Ships in your pack as packs/01-hreflang/hreflang-block.html

Where this file goes

In the words of the company that published the specification:

Google: "For each variation of the page, include a set of <link> elements in the <head> element, one link for each page variant including itself. The set of links is identical for every version of the page." And: "The <link> tags must be inside a well-formed <head> section of the HTML."

Their page: developers.google.com/search/docs/specialty/international/localized-versions

2. The preferred-source button

Google lets a reader mark your site as a source they prefer. Once they do, your pages carry a badge in Top Stories — and in AI Overviews and AI Mode. The lever is two lines of HTML, and most sites do not have them.

What we found

Paste the script line in <head> and the div where the button should appear; it renders in the reader's own language automatically. Checked 1 page(s): <https://vitadefence.com>

NOT CHECKED - Google decides eligibility algorithmically and there is no way to apply. Whether this domain appears in the picker can only be seen in Google's own picker, by a person.

What	Detail
not-present	no preferred-sources button and no fallback link on this page

The file this produces

The button, ready to paste, in the reader's own language.

1. This line goes in the `<head>` of every page:

```
<script async src="https://news.google.com/swg/js/v1/publisher.js"></script>
```

2. This line goes wherever you want the button to appear:

```
<div google-add-preferred-source-btn></div>
```

3. If your site cannot run the script, this plain link does the same job without it:

```
<a href="https://www.google.com/preferences/source?q=vitadefence.com">Add us as a preferred s  
ource</a>
```

Google's own badge artwork, all languages:

```
https://services.google.com/fh/files/helpcenter/google_preferred_source_badge_all_languages.z  
ip
```

Ships in your pack as `packs/02-preferred-sources/preferred-sources-button.html`

Where this file goes

In the words of the company that published the specification:

Google: "Embed an interactive button to your web pages, which lets readers seamlessly add your site as a preferred source and returns them to your page. By adding only two lines to your HTML, this option renders an automatically localized, Google-styled button that supports device and language customization."

Their page: developers.google.com/search/docs/appearance/preferred-sources

3. Can the answer engines read you

The crawlers everybody blocks are the ones that train models. They are not the ones that decide whether an assistant can quote you. Those are different, they are named differently at

every vendor, and blocking them by accident is easy — Apple, for instance, follows your Googlebot rule when you have not named Apple.

not checked

robots.txt could not be read (URLError: <urlopen error _ssl.c:1012: The handshake operation timed out>), so nothing is claimed

4. The plain-text summary for machines

A short file at the root of the site that tells an assistant, in plain markdown, what the business is and which pages matter. Chrome now audits for it.

What we found

Built from 25 of this site's own pages, using their real titles and descriptions - no sentence here was written by us

What	Detail
	3 list item(s) under 'What we sell' have no `[name](url)` link, which their spec requires
	5 list item(s) under 'Why a buyer might pick us' have no `[name](url)` link, which their spec requires
	3 list item(s) under 'Markets and websites' have no `[name](url)` link, which their spec requires
	5 list item(s) under 'Compliance' have no `[name](url)` link, which their spec requires
	2 list item(s) under 'Contact' have no `[name](url)` link, which their spec requires
	no rel="describedby" link pointing at the llms.txt - v2 of their spec added this and almost no tool emits it yet
	no rel="alternate" type="text/markdown" link to a markdown twin

The file this produces

The file itself, built from your own page titles and descriptions — not a sentence of it written by us — plus markdown copies of your main pages and the header line that points at them.

Vitadefence UK · Premium supplements · Made in the UK

> 63 premium supplements (mostly plant-based) · HPMC capsules · Made in the UK · GMP certified · FREE Royal Mail Tracked 48® delivery.

Pages

- [Vitadefence UK · Premium supplements · Made in the UK](https://vitadefence.com/): 63 premium supplements (mostly plant-based) · HPMC capsules · Made in the UK · GMP certified · FREE Royal Mail Tracked 48® delivery.

```

Ships in your pack as `packs/04-llms-txt/llms.txt`

Where this file goes

In the words of the company that published the specification:

```
llmstxt.org: "The file can be placed at the site root, or at any path within it, covering the pages under that path."  
The markdown copies go "at the same URL as the original page, either with .md appended (page.html.md) or with  
the extension replaced by .md (page.md)". The pointer "can be provided as HTML <link> elements, or as an HTTP  
Link: response header... and can be added in web server or CDN configuration without modifying any pages."  
Their page: llmstxt.org
```

5. What the site says about itself, in machine form

Structured data is how a business states its own name, phone, logo and profiles in a form a machine reads without guessing.

What we found

Built from 8 fact(s) this site states about itself. Nothing here was invented; anything Google's example wants that the site never says is listed under 'missing' for you to fill in. Validate with their Rich Results Test before shipping: search.google.com/test/rich-results

Google's own example also asks for these, and your site does not state them anywhere we can read — so they are left out rather than guessed at:

- a telephone number (no tel: link on the page)
- a postal address - their LocalBusiness example carries address as a PostalAddress with streetAddress, addressLocality, addressRegion, postalCode and addressCountry. This site does not state one anywhere we can read, so it is LEFT OUT rather than guessed
- opening hours and geo coordinates - same reason, left out

The file this produces

The blocks, built only from facts your site already states. Anything Google's own example asks for that your site never says is listed as missing rather than filled in — an invented address in structured data is a lie told in a format machines trust.

```

Ships in your pack as `packs/05-structured-data/organization.jsonld`

Where this file goes

In the words of the company that published the specification:

Google supports JSON-LD placed in a `<script type="application/ld+json">` tag - the blocks below already carry that tag, so each one is pasted into the page whole. Check the result with their own Rich Results Test before you ship it.

Their page: search.google.com/test/rich-results

6. Can a paragraph survive being quoted

An assistant answering a question lifts a passage out of a page. A paragraph that opens with *It*, *This* or *They* refers to something that lived in the paragraph before — lifted out, it means nothing.

What we found

369 of 421 paragraphs across 10 page(s) could be lifted out and quoted as they stand. 421 page(s) exist in the sitemap; 10 were read.

421 PARAGRAPHS READ	369 CAN BE QUOTED	10 PAGES SCORED
---	---	---------------------------------------

This is our own measure, not a published standard, and it is labelled that way wherever it appears.

The file this produces

A page-by-page list of the paragraphs that cannot survive being lifted, with the opening word that breaks each one.

```
url,paragraphs,liftable,liftable_ratio,orphan_openings
"https://vitadefence.com/",98,,1.0,0
"https://vitadefence.com/articles",73,,1.0,0
"https://vitadefence.com/articles/acai-berry-multi",40,,0.85,6
"https://vitadefence.com/articles/acerola-multi",36,,0.81,6
"https://vitadefence.com/articles/african-mango",29,,0.69,7
"https://vitadefence.com/articles/aloe-vera-multi",36,,0.86,3
"https://vitadefence.com/articles/amino-acid-multi",33,,0.7,9
"https://vitadefence.com/articles/apple-cider-multi",30,,0.87,3
"https://vitadefence.com/articles/apple-cider-vinegar",13,,0.92,1
"https://vitadefence.com/articles/artichoke-multi",33,,0.7,4
```

Ships in your pack as packs/06-quotability/quotability.csv

Where this file goes

In the words of the company that published the specification:

Nothing to install. This is a list of the paragraphs on your own pages that cannot survive being quoted, and the opening word that breaks each one, so they can be rewritten. It is our own measure, not a published standard.

7. The pages nothing links to

A page no link points at is a page a search engine may never find. This builds the three things that fix that: a complete sitemap file, an HTML page listing every address as a real link, and a footer block of the hub links.

What we found

423 address(es) found across 25 page(s) read. 421 are already in the site's own sitemap, 2 are not, and 0 sitemap entry/entries could not be read.

The file this produces

The finished sitemap.xml, the HTML sitemap page, and the footer block — built only from addresses your own site already has. No date is invented: a last-modified date appears only where your own existing sitemap already declared one.

1. Save this as sitemap.xml at the root of your site:

```
<?xml version="1.0" encoding="UTF-8"?>

Ships in your pack as `packs/07-discovery/sitemap-and-links.txt`

Where this file goes

In the words of the company that published the specification:

sitemaps.org (protocol 0.9): a Sitemap must "Begin with an opening `<urlset>` tag and end with a closing `</urlset>` tag", "Specify the namespace (protocol standard) within the `<urlset>` tag", "Include a `<url>` entry for each URL, as a parent XML tag" and "Include a `<loc>` child entry for each `<url>` parent tag". "All other tags are optional." "The file itself must be UTF-8 encoded." "All URLs in a Sitemap must be from a single host." Save the file at your site root and link the HTML version from your footer.

Their page: sitemaps.org/protocol.html

8. The trust signals a reader and a machine both look for

Eight mechanical, countable things a person can walk over to your page and check: a named author, a page about that author, a date a reader can see, links out to sources, concrete numbers, a way to make contact, an about page that answers, and a company identity.

not checked

the site could not be read (URLError: <urlopen error _ssl.c:1012: The handshake operation timed out>), so nothing is claimed

9. Which AI engines can actually reach you

“AI” is not one thing. The same site can be readable by one engine and invisible to another, and the reason differs per vendor — blocking one company’s user-fetcher costs you nothing, blocking another’s may reduce your visibility, in that vendor’s own words.

What we found

All 5 engine(s) checked can reach this site. Nothing to change. 6 item(s) are openly not checked. Nothing about them is claimed.

Nothing to fix here. Every engine we check can reach your site.

Ships in your pack as `packs/09-per-engine/per-engine.txt` — empty — nothing to fix

10. The extra machine-readable blocks your pages qualify for

Beyond the block that describes the business itself, a page can declare what it IS — an article, a product with a price, a piece of software. Machines read those declarations directly instead of guessing.

What we found

No block was produced. Nothing on this page marks it as an article, a product or a software application. Nothing was invented to make one. Check anything you publish with Google’s Rich Results Test: search.google.com/test/rich-results

Nothing to fix here. Nothing on the pages read marks them as an article, a product or a piece of software, so there is no extra block to add.

Ships in your pack as `packs/10-extra-blocks/extra-blocks.jsonld` — empty — nothing to fix

What is in your pack

Every file listed here is in the folder that came with this document. Files marked *empty* were produced by a check that found nothing to fix — the file is still there, and it says so inside.

How this was measured

8 of 10 checks ran against the live site. Every rule applied comes from the vendor's own published documentation (Google, OpenAI, Anthropic, Perplexity, Apple, llmstxt.org); the one exception is the last check, which is our own measure and is labelled as such. Did not complete: ai_crawlers, eat.
